## INTRODUCCION

Este **inventario** incluye más de 1700 plagas invertebradas asociadas a distintos cultivos anuales y perennes en América Central y en Areas contiguas.

La primera sección registra 84 cultivos (granos básicos, hortalizas, frutales y otros) con las plagas que los atacan.

La segunda parte es un listado taxonómico en orden alfabético, de las plagas citadas en los cultivos mencionados. Se incluyen plagas aun no asociadas con un cultivo determinado. La sección taxonómica permite verificar la escritura, nombres comunes, sinónimos y actualización de los nombres científicos de las plagas comunes en la región.

Este **inventario** es una actualización del catálogo "Plagas de Cultivos en América Central: una lista de referencia" de Saunders, King y Vargas (1984). Este trabajo se elaboró mediante un plan de investigación y consulta de las fuentes más importantes disponibles, en la siguiente forma:

- a. Análisis del material incluido en el libro "Plagas invertebradas de cultivos anuales alimenticios en América Central" de A.B.S. King y Joseph L. Saunders.
- b. Búsqueda y recopilación de literatura sobre cultivos y plagas no incluidas en la edición anterior de este inventario.
- c. Consulta de la colección de referencia de plagas y organismos benéficos del Area de Centroamérica, ubicada en CATIE.

El **inventario** es útil para extensionistas, investigadores, estudiantes y agricultores; por el lenguaje sencillo y la facilidad de uso como libro de consulta. Facilita el conocimiento de los invertebrados que atacan un cultivo determinado y así identificar las partes dañadas por esa plaga.

Los daños causados se clasifican según la parte afectada de la planta: Semilla (SE); Raíz, Tubérculo (RT); Tallo, Tronco, Pecíolo (T); Brotes, Botones (B); Follaje (FO); Flor (FL); Fruto (FR) y Producto Almacenado (P). Se describe el daño producido según el tipo de alimentación: Masticador (MAS); Succlonador, Raspador-Chupador (SUC); Minador, Barrenador (MIN) y Oviposición (OVI). Se indica el estado dañino como Adulto (A) o Inmaduro (I).

## INTRODUCTION

This **inventory** includes more than 1700 invertebrate pests of annual and perennial crops that occur in Central America and contiguous areas.

The first section presents pests by crop for 84 crops (basic grains, vegetables, fruits and others).

The second section presents an alphabetized taxonomic list of pest considered in the first section plus additional pests present in Central America that lack crop association information. This taxonomic list verifies scientific names, synonyms and common names for the region.

This **inventory** updates "Plagas de Cultivos en America Central: una Lista de Referencia" by Saunders, King and Vargas (1984). The following sources of information were consulted:

- a. The book "The Invertebrate Pests of Annual Food Crops in Central America" by A.B.S. King and J.L. Saunders.
- b. Literature search for information on crops and pests not included in first edition of this inventory.
- c. The CATIE reference collection of pests and beneficial organisms from the Central American area.

The **inventory** is useful for extensionists, researchers, students and farmers. It uses simple language, easy to use and facilitates recognition of invertebrate pests that attack a given crop.

Damage caused is classified by the plant part affected: Seed (SE); Roots and Tubers (RT); Trunks, Stems and Petioles (T); Buds and Shoots (B); Foliage (FO); Flower (FL); Fruit (FR); and Stored Product (P).

Damage is described by feeding type: Chewing (MAS); Sucking and Rasp-ing-Sucking (SUC); Mining and Boring (MIN) and oviposition (OVI). The stages that cause damage are indicated as Adult (A) or Immature (I).
